PROMPT

You are assisting with a small, public static portfolio website.

Project context:

- purpose: present my skills and internships to potential employers
- Existing system: an HTML / CSS / JavaScript portfolio template I will provide the template later
- Allowed changes: content, styling, and small front-end corrections
- Do not add: a backend, login system, analytics, or external data collection

Acceptance Criteria:

1. The landing page should display precise information about me like my name, university, and my current internship and studies
2. The portfolio should contain at least my 2 most recent internship's with job duties and achievements regarding them
3. the UI / UX should be responsive and easy to navigate
4. Ensure that the UI looks good on multiple display's example, mobile, table, and monitor
5. Do not reuse any information that is a placeholder.

Constraints: This portfolio will not require external hosting This portfolio will not require a database This portfolio will not require any form of credentials to access This portfolio will adhere to my professor's guidelines do not invent information that I have not provided you

First provide:

1. A file by file implementation plan
2. Any assumptions or risks
3. a proposed test checklist
4. any questions or requirements that must be addressed before implementation

DO NOT MODIFY FILES UNTIL I REVIEW THE PLAN

RESPONSE

Portfolio Website Implementation Plan

Thanks for the detailed context. Since this is a planning-only phase, I've outlined everything below **without making any code changes**. I have some important questions at the end that need answers before implementation can proceed correctly.

1. File-by-File Implementation Plan

Since you'll provide the existing template later, this plan assumes a typical structure. I'll adjust once I see the actual files.

index.html (Landing Page)

- Update <head> metadata (title, description) with your real name/role
- Hero section: Replace placeholder name, university, current internship/study status with your actual info
- Navigation bar: Ensure links (About, Experience, Projects, Contact) are semantic and keyboard-navigable
- Add alt text to any images (headshot, logos) for accessibility
- Ensure heading hierarchy (<h1> → <h2> → <h3>) is logical for screen readers

about.html or #about section

- Replace placeholder bio with your real background, university, degree program, and current studies

experience.html or #experience section

- Build two (minimum) structured entries for your most recent internships, each containing:
 - Company name, role title, dates (start–end)
 - 3–5 bullet points: duties performed
 - 1–2 bullet points: quantifiable achievements (if available)
- Use semantic HTML (<article> or <section> per internship) for structure and accessibility

styles.css

- Audit existing CSS for hard-coded pixel widths that break responsiveness
- Implement/verify CSS Grid or Flexbox for layout containers
- Add media queries for breakpoints (e.g., mobile ≤480px, tablet ≤768px, desktop ≥1024px)
- Verify color contrast ratios meet WCAG 2.1 AA (4.5:1 for normal text)
- Ensure font sizes use relative units (rem/em) for scalability

script.js

- Review existing JS for any unnecessary features (e.g., analytics snippets, external API calls) — **remove per your constraints**
- Keep only front-end interactivity (e.g., nav toggle for mobile, smooth scroll)
- No form submission logic requiring backend/database

assets/ (images, icons, resume PDF if applicable)

- Replace placeholder images with your actual headshot/project screenshots (only if you provide them)
- Optimize image file sizes for performance

2. Assumptions & Risks

Assumptions:

- The template uses standard HTML/CSS/JS (no framework like React) — please confirm
- You will supply real internship details, dates, and bullet points before I write copy
- "Two most recent internships" implies you currently have 2+ internships completed or in progress

Risks:

-  **Risk of invented content:** I will not write internship duties/achievements myself — I need this info from you directly to avoid violating your "no placeholder" rule
-  **Template unknown:** Until you share the actual files, my plan is a general framework, not a precise diff
-  **Professor guidelines unknown:** I don't know your specific rubric/requirements yet, which could affect file structure or content depth
-  Responsive testing without real device access — I'll rely on browser dev tools' device emulation guidance

3. Proposed Test Checklist

Content Accuracy

- Name, university, and current internship/study status are 100% accurate (no leftover template text)
- Both internship entries contain real company names, dates, duties, achievements

Responsiveness

- Layout renders correctly at 320px (small mobile), 768px (tablet), 1024px+ (desktop)
- Navigation menu collapses to a mobile-friendly pattern (hamburger or stacked links) below tablet breakpoint
- No horizontal scrolling on any breakpoint
- Images scale proportionally, no overflow/distortion

Accessibility (WCAG 2.1 AA)

- All images have descriptive alt text
- Color contrast passes for text/background combinations
- Site is navigable via keyboard only (Tab/Enter)
- Heading structure is logical and sequential

Functionality

- All internal links/navigation work correctly
- No console errors in browser dev tools
- No backend calls, forms, or data collection scripts present (per constraints)

Cross-Browser

- Verified in Chrome, Firefox, and Safari (or your preferred set)

4. Questions & Requirements Before Implementation

I need the following before I can begin actual edits:

1. **The template files** — please share the HTML/CSS/JS you mentioned.
2. **Your real information:**
 - a. Full name (as you'd like it displayed)
 - b. University name and current program/major/year
 - c. Current internship title, company, and status (ongoing/completed)
3. **Two most recent internships** — for each, please provide:
 - a. Company name, job title, start/end dates
 - b. 3–5 duties you performed
 - c. Any measurable achievements (metrics, outcomes, tools used)
4. **Professor's specific guidelines** — is there a rubric or written requirement I should align formatting/content to?
5. **Assets** — do you have a headshot photo, resume PDF, or project screenshots to include? Or should I leave clearly-labeled space for you to add later?
6. **Contact method** — should the contact section link to email/LinkedIn only (static links), confirming no contact form (since no backend is allowed)?

Once you provide the template and the information above, I'll revise this into a precise, file-specific diff plan for your review before any code is written.

AI Plan Review

Accepted Element

The most significant component of the AI-generated plan that I accepted was its approach to code generation. The AI helped remove substantial bloat from the existing codebase, resulting in a cleaner and more maintainable structure. Before accepting these changes, I reviewed the affected files and tested the website to confirm that no functionality had been removed.

Revised Element

I revised the AI's approach to parsing my resume and translating its content into the portfolio. During this process, the AI unexpectedly removed much of the past tense wording from descriptions of previous experiences. I manually corrected these changes.

Risks Identified by the AI

Risk 1: Inaccurate or Invented Internship Content

Risk: The AI indicated that it could not independently write descriptions of my internship duties and achievements without additional information.

Response: I provided the AI with information from my resume and carefully reviewed all generated portfolio content. I verified that the AI did not invent responsibilities, accomplishments, or other personal details.

Risk 2: Incomplete Knowledge of the Project Rubric

Risk: The AI noted that it did not know the project's full rubric or requirements, which could affect decisions about file structure, content depth, or implementation.

Response: I allowed the AI to continue without providing the complete rubric. Throughout development, I referenced the project's progress with the rubric. I determined that rubric-specific prompting was unnecessary because I could verify compliance during my own review process.

Risk the AI Did Not Identify

Risk: Monolithic File Structure

Risk: The AI initially attempted to implement the changes using a monolithic file structure. This approach could have reduced maintainability, made individual changes more difficult to review, and complicated version control.

Response: I took corrective action to prevent the project from becoming overly centralized. I also revised my prompting strategy so that the AI worked on smaller, incremental changes. This made the modifications easier to review, test, and track through version control.

Code Review

`index.html`: Portfolio Content

The AI modified `index.html` to include information I provided. Before accepting these changes, I reviewed the generated content to verify that:

- No information was invented.
- All personal and professional details were accurate.
- The wording was grammatically correct.
- Past and present experiences used the appropriate verb tense.

`script.js`: Quick-Navigation Feature

The AI modified `script.js` to add a keyboard based navigation feature. The feature allows a user to press the Tab key to return directly to the main page.

I tested this functionality by navigating to a different page and activating the keyboard shortcut. The feature performed as intended. However, after evaluating it, I determined that it was less useful than the AI had suggested. The AI likely implemented it because of the project's acceptance criteria.

index.html: Code Reduction and Refactoring

The AI removed a substantial amount of code from `index.html`. Because extensive code removal can unintentionally affect core functionality, I reviewed the changes carefully.

I tested the website before and after the refactoring and compared its behavior. After confirming that all essential components continued to function and the site responded as intended, I approved the changes. This refactoring reduced unnecessary code while preserving the website's required behavior.
